

Description:

Aluminum rugby goal made according to regulations on sports facilities and recreation **(NIDE Rugby)**.

The goal consists of two vertical posts of 8 meters of height and a transverse of 5.6 meters; made in round steel tube of diameter 120 mm and 90mm. These profiles are manufactured by an extrusion process, providing them with a internal rib that gives them the strength that the goal as a whole needs.

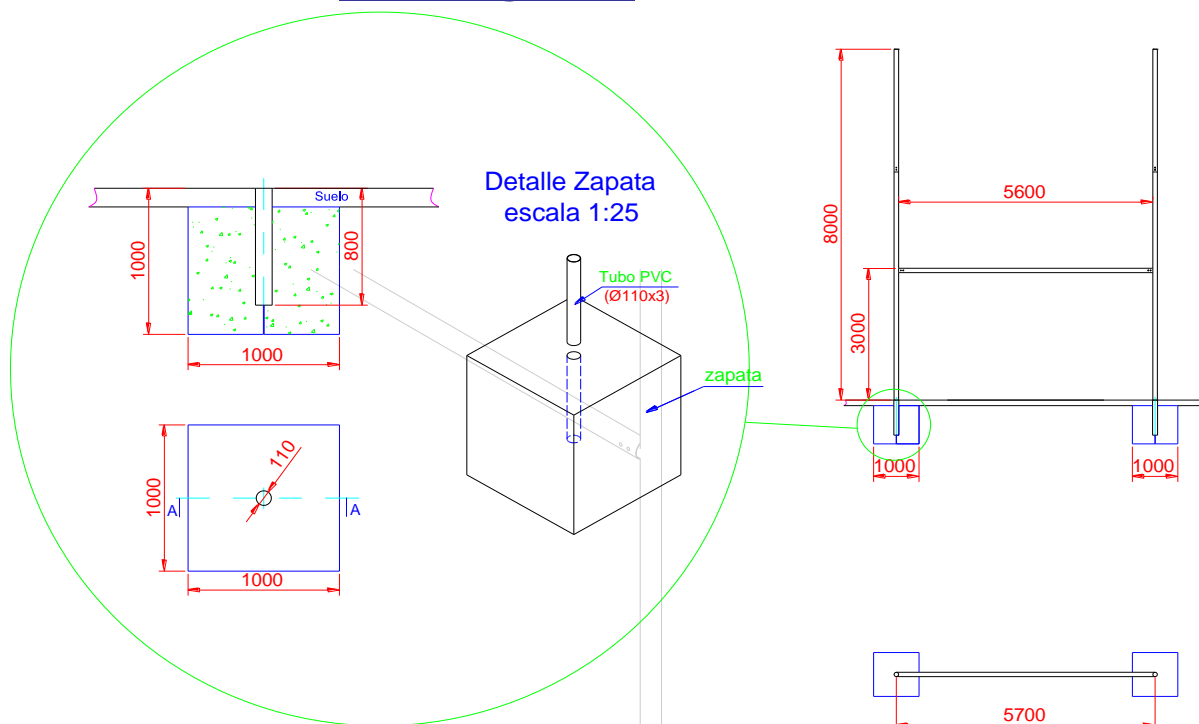

The goal set is embedded below the playing surface 1000 mm by means of concrete base, designed and calculated to comply with current legislation, offering the strength and stability required by the goal.

The bolted joints between the posts are perfectly embedded and hidden, not protruding from the joint structure of the goal, thanks to precise machining performed on the aluminum posts.
